

# Are changing strategic directions impacting your business operations?

## Cloud Strategy

Cloud is not just Infrastructure as a Service, but a wide array of 'as a Service' implementations. This wide array is one of the reasons organisations find it difficult to navigate the cloud journey themselves, when they have little internal experience and are bombarded by vendors with their own versions of cloud.

Preparing an organisation for cloud is not just a technical implementation but an organisational change journey as well. This organisational change impact makes it key that the direction is broadly supported and championed within the organisation from the top down.

**Diaxon can get your company ready for the cloud journey**

## SERVICE OVERVIEW

Discovery

We use a combination of tools and workshops with key staff to collect the information about the environment, existing application and infrastructure documentation, existing assessments, current projects etc. This is then used to inform the further stages of work across the cloud strategy, infrastructure assessment, application assessment, roadmap and business case.

Future state design

Leveraging the information gathered from the discovery phase we ensure the business objectives are clear, measurable and meaningful. This allows areas such as risk and security to be addressed.

Business case and implementation roadmap

The roadmap provides the execution capability of the future state design while the business case takes in multiple aspects of the work but focuses on the roadmap.

## Deliverables

- Future state design -
  - Business objectives
  - Success factors
  - Architecture
  - Identification of inflight project impacts
  - Privacy and security
- Commercial model
  - Implementation Roadmap
  - Current state description
  - Performance of current state
  - Application cloud readiness assessment
  - Business case
